Not illustrated. 1921 Excerpt: .one of which has an admittance, $-G + jB$, and the other of which has an admittance, $Y_2 G_2 + jB_2$, the total admittance, Y , of the combination is the vector sum of the two admittances Y_1 and Y_2 . $Y = Y_1 + Y_2$ (167) $G_1 + jB_1 + G_2 + jB_2$ (168) This relation can be stated generally that When several impedances are in parallel, the total admittance of the combination is the vector sum of the separate admittances. 7, Resonance. In an a.c. circuit having both capacity and inductance in series, the reactance is zero whenever the capacity reactance is equal in magnitude to the inductive reactance, that is, when $X = X_q$ as can be seen from equation (136- b). The frequency at which this occurs is called the resonant frequency. At resonance the impedance has a minimum value and is equal to the resistance of the...
